			2191	
			MAIL DATE	DELIVERY MODE
			04/16/2008	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

## Application No. Applicant(s) 09/449,782 MCKEETH, JAMES Office Action Summary Examiner Art Unit MATTHEW J. BROPHY 2191 -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --Period for Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS. WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status 1) Responsive to communication(s) filed on 17 January 2008. 2b) This action is non-final. 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213. Disposition of Claims 4) Claim(s) 1-21 and 23-25 is/are pending in the application. 4a) Of the above claim(s) is/are withdrawn from consideration. 5) Claim(s) is/are allowed. 6) Claim(s) 1-21 and 23-25 is/are rejected. 7) Claim(s) \_\_\_\_\_ is/are objected to. 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement. Application Papers 9) The specification is objected to by the Examiner. 10) The drawing(s) filed on is/are; a) accepted or b) objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) The oath or declaration is objected to by the Examiner, Note the attached Office Action or form PTO-152. Priority under 35 U.S.C. § 119 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) ☐ All b) ☐ Some \* c) ☐ None of: Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). \* See the attached detailed Office action for a list of the certified copies not received.

#### DETAILED ACTION

1. This office action is in response to amendment filed January 17, 2008.

Claims 1-25 are pending.

### Response to Amendment

### Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior at are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-21 and 23-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over USPN 6,182,279 to Buxton, in view of USPN 5,758,154 to Qureshi, in view of "The Windows NT Command Shell" by Tim Hill (hereinafter Hill) (1998), and further in view of Apolicant's Admitted Prior Art (hereinafter AAPA).

#### Per claim 1:

- -invoking, by an application, a call of a command line utility, the application providing an identifier in the call of the command line utility, wherein the command line utility is a utility executable from a command line prompt;
- -receiving output from the command line utility;
- -storing the command line utility output in a system storage at a location identified by the identifier:

Application/Control Number: 09/449,782 Art Unit: 2191

-retrieving, by the application, the command line utility output form the system storage at the location identified by the identifier.

Buxton disclosed invoking a utility (col. 8, line 7) to modify and store the customized component/template component in the registry, using a (col. 13, lines 8-15) template Storage DLL to manage registration of templated components to keys, subkeys, etc. Col. 8, lines 8-11, modify registry Col. 14, lines 20-28, store at a registry key (a location identified by an identifier)

Col. 10, lines 8-10, OLE libraries use the registry key information to find information about the OLE control (key values) (retrieving, by the application, the command line utility output from the system storage at the location (key / subkey location) identified by the identifier (the key).

Buxton disclosed (col. 8, lines 45-50) a user interface or command line interpreter is used to invoke the application (the template customization application) that ultimately stores customization information as output in the registry.

Qureshi more clearly disclosed (col. 3, lines 26-46) an application call to a registration routine via system calls, to store an identifier in the registry. Col. 4, lines 2-7, invoke the registration routine, pass configuration file to the registration routine, open the configuration fill and add the configuration file information to the registry. Col. 4, lines 58-67, DIIRegisterServer routine Col. 5, lines 56-59, "The application programs invoke operating system routine in order to access the various services provided by the

operating system...The application programs invoke the registration...provided by the registration DLL to register...configuration information...The registration...routines of the registration DLL call operating system routines to write information to the registry file..." Col. 8, lines 48-67, "DIIRegisterServer opens the specified key...calling the system routine RegOpenKey...DIIRegisterServer creates the key..."

More explicitly,

Hill disclosed WindowsNT shell commands, CMD redirection, including the pipe redirection

(page 2) "By far the most common use for a console window is to execute the Windows NT command shell. The command shell defines the Windows NT scripting language and is responsible for processing scripts, as well as commands typed at the keyboard."

Pipe (|) character.

"The command shell is a console application."

(page 4)

\$B

Table 2.1 Special Characters in a Shell Prompt
Character Description

Art Unit: 2191

### (page 6) CMD.EXE and COMMAND.COM

Because all commands are actually executed by CMD.EXE (the Windows NT command shell)...

## (page 9) Command Redirection

Most console applications and **commands generate output**, and many accept input. This input or **output is in the form of a stream of characters (either ANSI or Unicode)**. Applications generally work with up to three streams, as follows:

The command shell provides facilities to change the default stream input and output. These facilities are accessed by placing special command redirection symbols in a command.

(page 10) Table 2.4 Command Redirection Symbols

Symbol Description

>file Redirects command output to the file specified. You can also use

a standard device name such as LPT1, CON, PRN or CONOUT\$ as

the file name. Any preexisting contents of the file are lost.

cmd1 | cmd2 Pipes the command output of cmd1 to the command input of

cmd2. Multiple pipe characters are allowed, creating a chain of commands, each sending output to the next command in the chain.

Art Unit: 2191

Command redirection symbols are not visible to the command. The shell processes them before the command is executed and they are not passed as arguments to the command. The <, >, and | symbols are reserved shell characters. If these symbols must be passed as command arguments, instead of being used as redirection symbols, then they must be escaped using the ^ character.

The > redirection symbol redirects command output to the specified file.

The | (pipe) redirection symbol sends the command output of cmd1 to the command input of cmd2. For example:

C:\>dir | sort

This example sends the command output of the DIR command to the command input of the SORT command. The output from the SORT command is then displayed. Alternatively, the SORT output can be sent to another command. For example:

C:\>dir | sort | more

This example sends the command output of the DIR command to the command input of the SORT command. Then, the command output of the SORT command is sent to the command input of the MORE command. Finally, the command output of the MORE command is displayed.

(page 12) When the command shell processes a pipe (|) symbol, it actually runs both commands specified simultaneously. The right hand command is suspended until the left hand command begins generating command output. Then, the left hand command wakes up and processes the output. When this output has been processed, the command is again

suspended until more input is available. The synchronization of both commands is handled

automatically by the command shell and Windows NT.

The pipe symbol is both a redirection symbol and a compound command symbol.

Compound commands are discussed in the next section.

(page 12) Using Command Filters

The previous sections showed how individual commands can be combined using command

redirection and compound command symbols. Although command redirection can be used with

any command, it is most effective with commands that are specifically designed as command

filters. Generally, a command filter reads command input, permutes, or processes the input in

some manner, and then writes the permuted input to its command output. Command filters are

typically connected to other commands and each other via the pipe (|) redirection symbol.

Command filters are frequently used in scripts to extract specific information needed by a script.

Typically, a FIND command can filter the output of a command, extracting only the line (or

lines) which contain the required information. The script can then further process this filtered

data. Many of the sample scripts in Part II use this technique.

Windows NT provides four command filters:

\*The MORE command, which is used to paginate command output.

\*The SORT command, which can sort command output alpha-numerically.

\*The FIND command, which filters lines that contain a specified text string.

\*The CLIP [RK] command, which captures command output to the Windows NT clipboard.

AAPA disclosed FIG. I (page I, line 28), an application invoking the command line utility. AAPA disclosed (page I, line 19) command line utility output, piped to a temporary file, said temporary file created by the piping operation. AAPA notes problems associated with such a temporary file: the command line utility may not have file creation privileges on the computer system (page I, line 29), an error may be generated if the disk is too full to create a new file (page 2, line 2-3). Along error (page 2, line 3-3). Applicant's invention to the content of the problems of the content of the problems of

However, it would have been obvious, to one of ordinary skill level in the art, at the time of the invention, to modify the method / system / storage device, as disclosed in AAPA, FIG. 1, to overcome the possible disadvantages noted above, as related to creating a temporary file, using WindowsNT known redirection and piping commands, because piping the output of a script command, to be used as an input to a registry edit command is an efficient use of resources. The results are as expected. Registry parameter values in a registry database storage location are modified without the need to create a temporary storage location. One would be motivated to ensure that sufficient resources exist to store utility output, and to otherwise manage memory.

The combination is obvious because teachings are found in the prior art, and combined, with no change in functionality. It is a mere use of common sense by one skilled in the art to select and combine such known elements with no new function, i.e., a predictable result.

The predictable result, utility output directly stored to a system storage, at a location identified by an identifier. A subsequently invoked application will retrieve the modified values from the system registry.

## Regarding claim 2, Buxton teaches:

-providing the identifier comprises providing an identifier that identifies one or more entries in a system registry database.

(Fig. 2, item 205 and col. 13, lines 14-15, "...registry keys are created..." Also see col. 14, lines 29-59, "To facilitate loading of template onto another system...a number of registration key or subkey are included with template. Each template may have the keys 450A-I, as illustrated in Fig. 4C...Key 450H contains information indicating the name of the storage object in template storage file where initialization data...may be located...Key 450I contains information identifying the CLSID...)

#### Regarding claim 3, Buxton teaches:

-providing a root key identifier.

(Col. 11, line 2: "Most OLE object application information is stored in subkeys under the CSLID root key..." Also see col. 17, lines 35-41, "Component loader loads, verifies and checks the license of a component by replacing in registry the InProcessServer 32 entry, i.e. key 450A...and adding additional registry keys 450B-J, as previously

Art Unit: 2191

described, that will let the component loader (receiving a root key identifier) then load the correct OLE control.")

#### Regarding claim 4, Buxton teaches:

-providing a sub-key identifier.

(Col. 11, line 2 and col. 14, line 31: To facilitate loading of template...a number of registration or subkey are included with template...")

### Regarding claim 5, Buxton teaches:

-system registry database comprises an operating system registry database.

(Col. 4, line 49: "Operation of computer system is generally controlled...by operating system software, such as...Windows95...")

## Regarding claim 6, Buxton teaches:

-providing a system storage identifier.

(Col. 12, lines 20-21, "...users identify...templates to be packaged..." Also for another example of receiving a system storage identifier, see col. 20, lines 42-45, "...relevant character string from the registry is converted to CLSID. The component loader (receives a system storage identifier) then calls the GetClassObject to retrieve the real component's class factory...")

## Regarding claim 7, Buxton teaches:

Art Unit: 2191

-providing the system storage identifier comprises providing an identifier indicating a

system registry.

(Col. 10, line 66 – col. 11, line 4: A CLSID identifies the functionality of an object class

that can display...access to property values...A subkey is used by an OLE to find out

information about the control.")

Regarding claim 8, Buxton teaches:

-providing an identifier indicating shared system memory.

(Col. 8, lines 6-7: "OLE libraries (shared) comprise the set of system-level services in

accordance with the OLE specification...")

Regarding claim 9, Buxton teaches:

-providing the identifier indicating shared system memory identifies a system clipboard

memory.

(Col. 11, line 6: "An FORMATETC...is an OLE data structure which acts in a

generalized clipboard format...")

Regarding claims 10, Buxton teaches:

-receiving output directly from the command line output utility.

As an example, a utility modifies (utility output) the registry (col. 8, lines 8-11).

Regarding claim 11, Buxton teaches:

Art Unit: 2191

-receiving output from the command line output utility through a subsequent command

line output routine.

As an example, (col. 8, lines 28-29) "Data items within the registry are retrievable

(receive output) via calls (from utility call) to the WIN32 APIs."

Regarding claim 12, Buxton teaches:

-associating each line of command line utility output with a line identifier in the system

storage.

As an example, (col. 3, lines 1-9) "Template storage with a means for indexing,

including key information associated with the template. "...a memory having one or

more locations, means for indexing one or more locations within the memory..." Also

col. 13, lines 35-44, templates are stored with an enumerated decimal number: "Each

template is stored in an ISTORAGE whose name is unique...and may have the form

TEMPLEnnn, where nnn may be a decimal number.")

Regarding claim 13, Buxton teaches:

-setting each line identifier to a value corresponding to a position of that line in the

command line utility output.

(Rejection of claim 12 is incorporated and further claim contains limitations as recited in

claim 12. Therefore claim 13 is rejected under the same rational as claim 12.)

Regarding claim 14, Buxton teaches:

-setting a default value of the provided identifier to equal the total number of command utility output lines stored in the system storage. (Rejection of claim 12 is incorporated and further claim contains limitations as recited in claim 12. Therefore claim 14 is rejected under the same rational as claim 12.)

### Regarding claim 15, Buxton teaches:

A program storage device, readable by a computer, comprising instructions stored on the program storage device for causing the computer to:

- -cause an application to invoke a call of a command line utility, the application providing an identifier in the call of the command utility;
- -receive output from the command line utility;
- -store the command line utility output in system storage at a location identified by the identifier;
- -cause the application to retrieve the command line utility output from the storage at the location identified by the identifier.

See rejection of limitations in claim 1 above. This is a "program storage device" version of claim 1. See Figure 2 regarding Buxton's disclosure of a "program storage device."

### Regarding claim 16, Buxton teaches:

 -instructions to store command line utility output in an operating system registry database. Application/Control Number: 09/449,782 Page 14

Art Unit: 2191

As an example (Fig. 2, item 205 and col. 13, lines 14-15), "...registry keys are

created..." and (col. 13, lines 10 – 15) "...Template storage DLL ensures all additional

registry keys...are created..." Modified components cause the registry keys to be

created / edited / modified (REGEDIT utility).

Regarding claim 17, Buxton teaches:

-instructions to store command line utility output in an operating system maintained

volatile memory.

As an example, (Fig. 1, item 110-volatile storage).

Regarding claim 18, Buxton teaches:

-instructions to receive one or more lines of output from the command line utility.

See rejection of limitation in claim 1 above.

-instructions to store each of said one or more lines of output in the system storage.

As an example, (col. 14, lines 26-29) "The remainder of the operating system registry

entries are generated by code (instructions to store) in the template storage DLL and

are stored in both registry (store output / modified component data in system storage)

and the template.")

Regarding claim 19, Buxton teaches:

Art Unit: 2191

-instructions to associate a unique identifier with each of the one or more lines of output

stored in the system storage.

See rejection of limitations in claim 2 above.

Regarding claim 20, Buxton teaches:

-instructions to set a value associated with the received identifier in the system storage

equal to the number of lines of output stored in the system storage.

(Rejection of claim 18 is incorporated and further claim contains limitations as recited in

claim 12. Therefore claim 20 is rejected under the same rational as claim 12.)

Regarding claim 21, Buxton teaches:

A computer system, comprising:

a processor;

-a command line utility:

-an application executable on the processor, the application to call the command line

utility, the application to provide an identifier in the call;

-a system storage having a location identified by the identifier, the location identified by

the identifier to store an output of the command line utility,

-the application to retrieve the command line utility output from the location identified by

the identifier.

As an example, see FIG. 1. Claim 21 contains limitations as recited in claim 1,

therefore claim 21 is rejected under the same rational as claim 1.)

## Regarding claim 23, Buxton teaches:

-the command line utility comprises a first command line utility, and wherein invoking the call by the application comprises invoking a call to pipe output of a second command line utility to the first command line utility...

-wherein storing the command line utility output comprises storing the command line utility output of the first command line utility.

Col. 8, lines 6-7 disclose the OLE libraries comprise the set of system level services (system utilities). As an example of system utilities (col. 20, lines 17-43) Buxton disclosed reading a sub-key from the registry, use the output to determine the real component CLSID, determine whether a valid certificate and license exist, pipe the relevant character string to a CLSID, etc.

Additionally see rejection of claim 1 above.

## Regarding claim 24, Buxton teaches:

-the command line utility comprises a first command line utility, and wherein invoking the call by the application comprises invoking a call to pipe output of a second command line utility to the first command line utility...

-wherein storing the command line utility output comprises storing the command line utility output of the first command line utility.

This is a 'program storage device' version of claim 23 above. See rejection of claim limitations in claims 15 and 23 above.

## Regarding claim 25, Buxton teaches:

-the command line utility comprises a first command line utility, the system further comprising a second command line utility, the application to invoke a call that causes output of the second command line utility to be piped to the first command line utility...
-the location identified by the identifier to store output of the first command line utility.

This is a 'system' version of claim 23 above. See rejection of claim limitations in claims 21 and 23 above.

#### Response to Arguments

Applicant's arguments filed s January 17, 2008. have been fully considered but they are not persuasive.

## In remarks, Applicant Argues:

As previous argued in both the Response To Final Office Action mailed May 23, 2007 and the Pre-Appeal Brief Request for Review mailed July 23, 2007, Buxton does not discloses a "utility," or a "command line utility" as recited in independent claims 1, 15, and 21. The Examiner cites "OLE libraries" and "system-level services" as disclosing "invoking a utility." Office Action, page 3. As clearly stated in Buxton, OLE libraries are "system-level services in accordance with the OLE specification 2.0." Buxton, col. 8, lines 6-8. (Emphasis added). Further, such OLE libraries utilize and call "WIN32 APIs."

Application/Control Number: 09/449,782 Art Unit: 2191

Id., col. 8, lines 8-11. As stated in Buxton, APIs are "application program interfaces." Id., col. 7, lines 59-60. As would be clear to one having ordinary skill in the art, "application program interfaces" and "system-level services" are quite different than a "utility," especially a "command line utility" that is "a utility executable from a command line prompt" as recited in the independent claims. Neither "application program interfaces" nor "system-level services" are "executable from a command line prompt." Additionally, even if Buxton disclosed a "utility," it clearly does not disclose a "command line utility" as recited in independent claim 1, 15, and 21. Further, Applicants strongly object to any attempts by the Examiner to separate the term "utility" from the modifier "command line." A "command line utility" is a specific term recited in independent claims 1, 15, and 21 and supported in the specification as "a utility executable from a command line prompt." Applicants assert that the Examiner cannot disclose a "command line utility" by citing a reference that discloses a "utility" and does not mention the entire term "command line utility."

#### Examiner's response:

Examiner respectfully disagrees. Examiner reminds the applicant that each claim is to be given its broadest reasonable interpretation. While examiner understands the distinction that applicant attempts to make here, Examiner believes the term "utility", when given its broadest reasonable interpretation is anticipated by the Buxton patent. Further, while examiner agrees that the exact phrase "command line utility" is not present in Buxton's disclosure, the command line interpreter (see Col. 8, Buxton) as well as the invoking of the APIs (i.e. utilities) seen in Column 8 of Buxton.

Art Unit: 2191

## In remarks, Applicant Argues:

With regards to Qureshi, the Examiner has not made any attempt to state what, if any, of the present claim features are disclosed by Qureshi. The Examiner states that Qureshi discloses "an application call to a registration routine via system calls, to store an identifier in the registry." Office Action, page 3. While the Examiner's characterization of Qureshi may be correct. Applicants respectfully submit that Qureshi does not disclose any of the claim features of claims 1, 15, and 21. As stated in Qureshi, Qureshi discloses a registration routine implemented in a "registration DLL." Qureshi, col. 8. lines 1-3. As known to one having ordinary skill in the art, a DLL is a "dynamic link library." A DLL, and the routines accessible within a DLL, are far different than a "command line utility" that is a "utility executable from a command line prompt" as recited in the present independent claims. Further, Qureshi does not mention the words "command line," "utility," or "command line utility." Thus, Applicants remain confused as to which claim features, if any, the Examiner believes Qureshi is disclosing. As such, Applicants assert that Qureshi does not disclose any claim features of independent claims 1, 15, and 21.

### Examiner's response:

The examiner has relied on the Qureshi reference herein to show the storing of information in a location "identified by an identifier". More specifically, as described

Application/Control Number: 09/449,782 Art Unit: 2191

above, it more discloses a registration routine via system calls to store an identifier in the registry (Col. 3, Lines 26-46).

## In remarks, Applicant Argues:

Turning now to Hill, the Examiner states that Hill discloses "WindowsNT shell commands" and "pipe redirection." Office Action, page 4. Further, the Examiner states that "it would have been obvious at the time of the invention, to modify the method/system/storage device, as disclosed in AAPA, FIG. 1...using WindowsNT known redirection and piping commands, because piping the output of a script command, to be used as an input to a registry edit command is an efficient use of resources." Id., page 8. Applicant respectfully asserts that the Examiner misstates and/or misunderstands the function of the redirection and pipe commands disclosed in Hill. The redirection command ">" referred to in Hill redirects the output of a command line utility to a file. Hill, pages 10-11. As discussed in the specification of the present Application, redirecting or "piping" to a file is undesirable for a number of reasons and is clearly different than the subject matter recited in independent claims 1, 15, and 21. Application page 1. Further, the Examiner acknowledged that redirecting to a file is different than the present Application by noting that "Applicant claims novelty in providing a mechanism by which an application program may obtain output from a command line utility without the need to create a temporary file." Office Action, page 8. (Emphasis added).

Art Unit: 2191

Similarly, the "pipe" command 'T' referred to in Hill "pipes" or "redirects" the output of a command line utility to another command line utility. Hill, page 11. The pipe command is well-known in the art and is used to string together command line utilities, as illustrated in the examples in Hill. Id. As clearly set forth in the independent claims, such as independent claim 1, Applicants recite "invoking a command line utility by an application," "storing the command line utility output in a system storage at a location identified by an identifier," and "retrieving the command line utility output from the system storage at the location identified by the identifier." Neither the redirect command (redirects to a file) nor the pipe command (redirects or pipes to another command line utility) disclose these claim features, or the similar claim features of independent claims 15 and 21. Thus, neither of these two commands disclosed in Hill disclose the recited features of independent claims 1, 15, and 21.

#### Examiner's Response:

Examiner respectfully disagrees. Specifically, the command redirection taught in Hill does not teach redirection to a "temporary file"; the file of Hill is not temporary. Instead the file of hill, which is stored on a computing system anticipates the "system storage" of the current claim limitation. Finally, it is noted that the applicant's argued novelty "without 'he need to create a temporary file" appears nowhere in the claim language and therefore is not required by the claim.

In remarks, Applicant Argues:

Finally, the Examiner attempts to provide a combination that renders obvious independent claims 1, 15, and 21 by stating that "it would have been obvious, to one of

Art Unit: 2191

ordinary skill in the art, at the time of the invention, to modify the method/system/storage device as disclosed in AAPA, FIG. 1, to overcome the possible disadvantages noted above, as related to creating a temporary file, using WindowsNT known redirection and piping commands, because piping the output of a script command to be used as an input to a registry edit command is an efficient use of resources... [t]he results are as expected." Office Action, page 8. As stated above, neither the redirection nor piping commands disclosed in Hill allow piping to a system storage location such as a registry. Additionally, Applicants object to the Examiner's assertion that piping the output of a script command to a registry edit command is obvious because it is an efficient use of resources. The Examiner's statement is conclusory and simply assumes that because Applicant's claims are an efficient use of resources, they must be obvious. Applicants believe that, at best, such a statement is an impermissible use of hindsight and simply seeks to provide an obviousness rejection where no such conclusion is supported by the cited references. Further, in addition to the deficiencies described above with regard to the cited references, Applicants assert that the Examiner did not point out or cite any reference that discloses "retrieving" or "causing the application to retrieve" the command line utility output from the storage or location identified by the identifier, as further recited in independent claims 1, 15, and 21.

Accordingly, Buxton, Qureshi, Hill, and AAPA, taken alone or in combination, do not disclose each and every feature recited in the present independent claims, nor has the Examiner set forth a proper basis for combining the references in the manner recited.

Art Unit: 2191

As such, whether taken alone or in combination, the cited references do not render obvious independent claims 1, 15, and 21 and the claims dependent therefrom.

Examiner's Response:

Examiner's Response:

From KSR, 550 U.S. at \_\_\_\_, 82 USPQ2d at 1396.:

The obviousness analysis cannot be confined by . . . overemphasis on the importance of published articles and the explicit content of issued patents. . . . . In many fields it may be that there is little discussion of obvious techniques or combinations, and it often may be the case that market demand, rather than scientific literature, will drive design trends.

The use of the hill reference in overcoming the shortcomings of AAPA, Would have been obvious to one of ordinary skill in the art at the time of the invention, as desribed above, as the improvement of resource efficiency is a well-known "market demand" such as described in the KSR ruling above.

Also the retrieving of the command line utility output has been anticipated bye Buxton (see e.g. Col. 10, Lines 8-10) as described above.

#### Conclusion

 THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not

Art Unit: 2191

mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MATTHEW J. BROPHY whose telephone number is 571-270-1642. The examiner can normally be reached on Monday-Thursday 8:00AM-5:00 PM EST

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wei Zhen can be reached on (571) 272-3708. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
